

Neutralizing Nuclear Radiation Fallout

Radioactive iodine-131, cesium-134, cesium-137, tellurium-132, krypton, barium and xenon have been detected from the Japanese nuclear reactors

Potassium iodide pills only protect from radioactive iodine. They may have serious side effects for people with certain allergies, kidney and thyroid problems. Excess can cause vomiting and bleeding.

Bio-algae concentrates Chernobyl research:

- 1. Leukemia—dangerously low white blood cell counts of about 1000, rose to 3000 in 20 days.**
- 2. Regeneration of bone marrow, spinal fluids, blood and liver cells damaged by radiation.**
- 3. Reduction in children’s urine radioactivity levels by 50% in only 20 days.**

**Why protect against only radioactive iodine?
Use whole superfood microalgae to protect the **WHOLE** body!**
